Dynamic pipeline = Loop + Parameterized Copy Activity to handle multiple files efficiently

- Find Very important keyword

Dynamic pipeline = Parameterized Copy Activity + ForEach loop to handle changing file, folder, and URL automatically

Create new pipeline
Now in the pipeline go to move and transform and drag and drop copy data

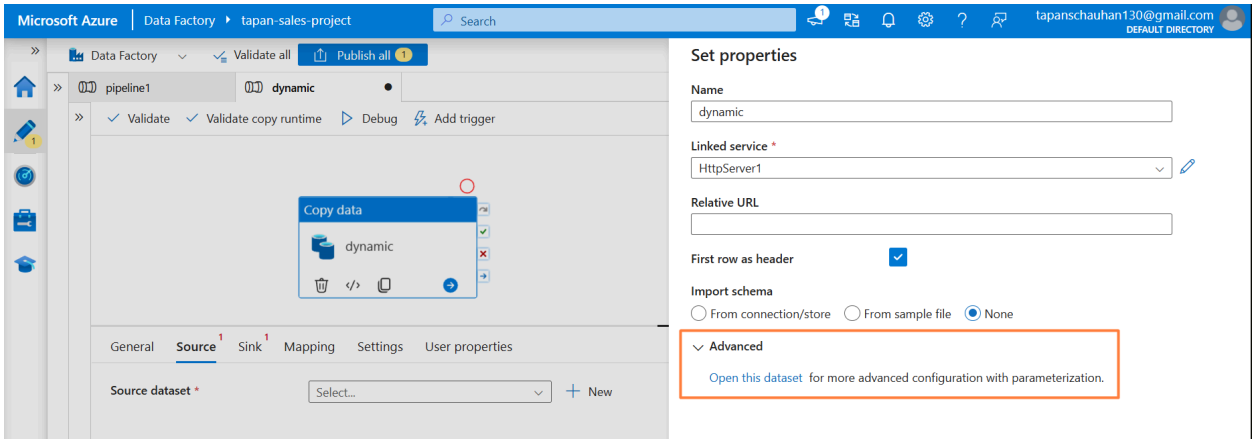
Now we will pass parameters

Now in the pipeline open source and create a new source and click http and select file type as csv and then select the link service and paste the relative URL of that csv file

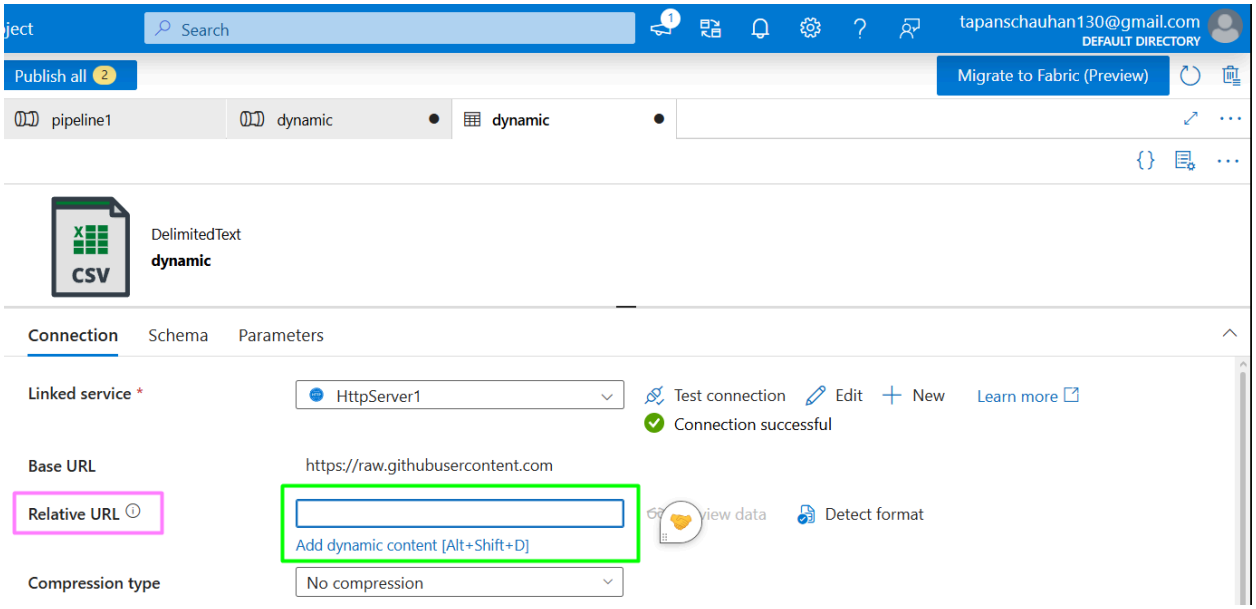
The base url will be same but the relative url will keep on changing
So we wil not create a linked service

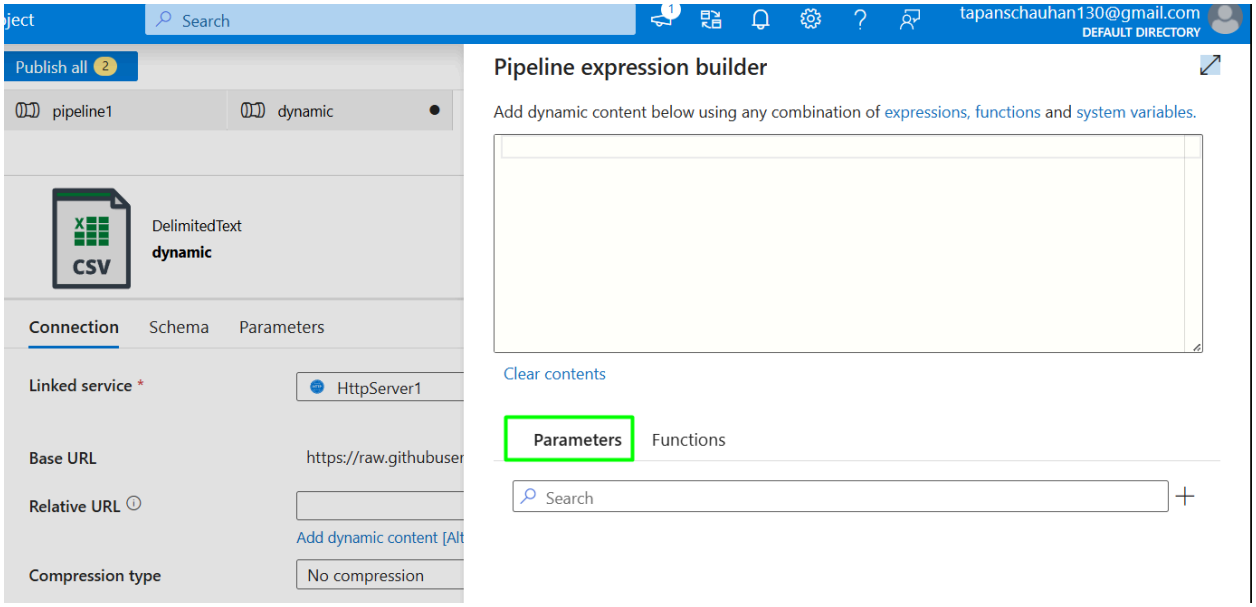
We will create data set in a parameterized

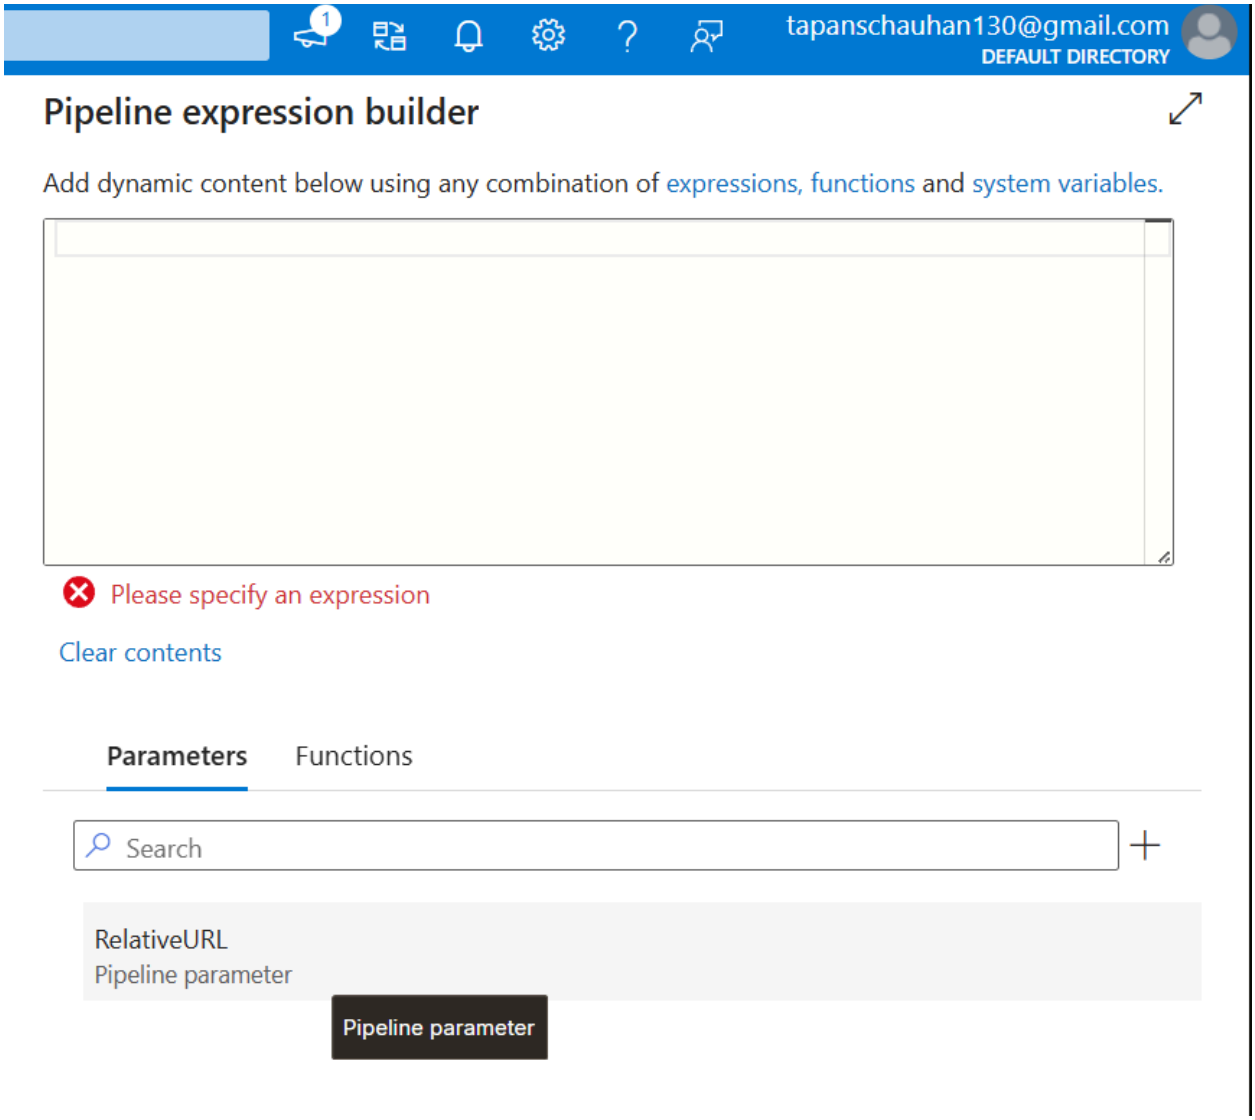
We will create parameters by clicking on advance



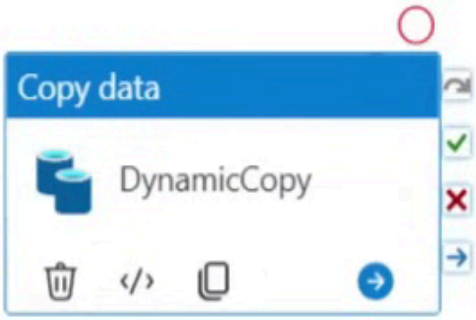
Add dynamic content



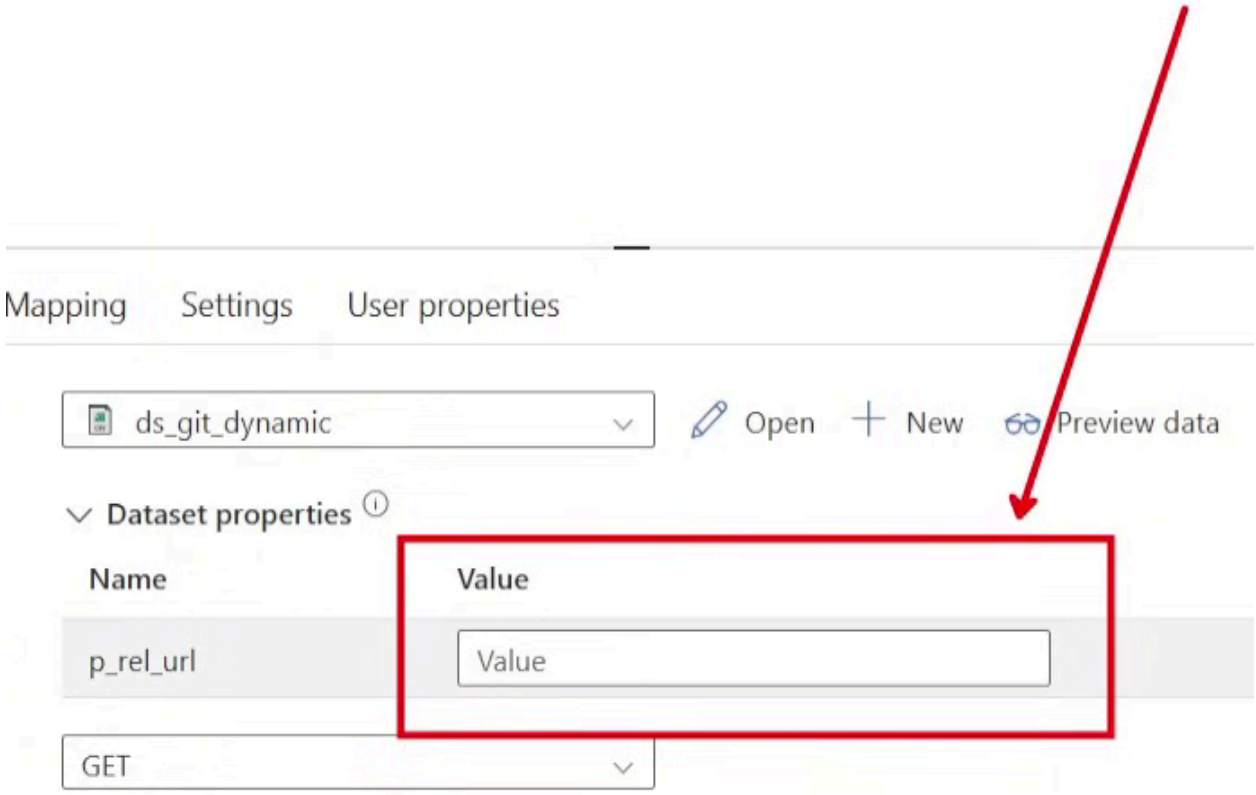




Select this relative url

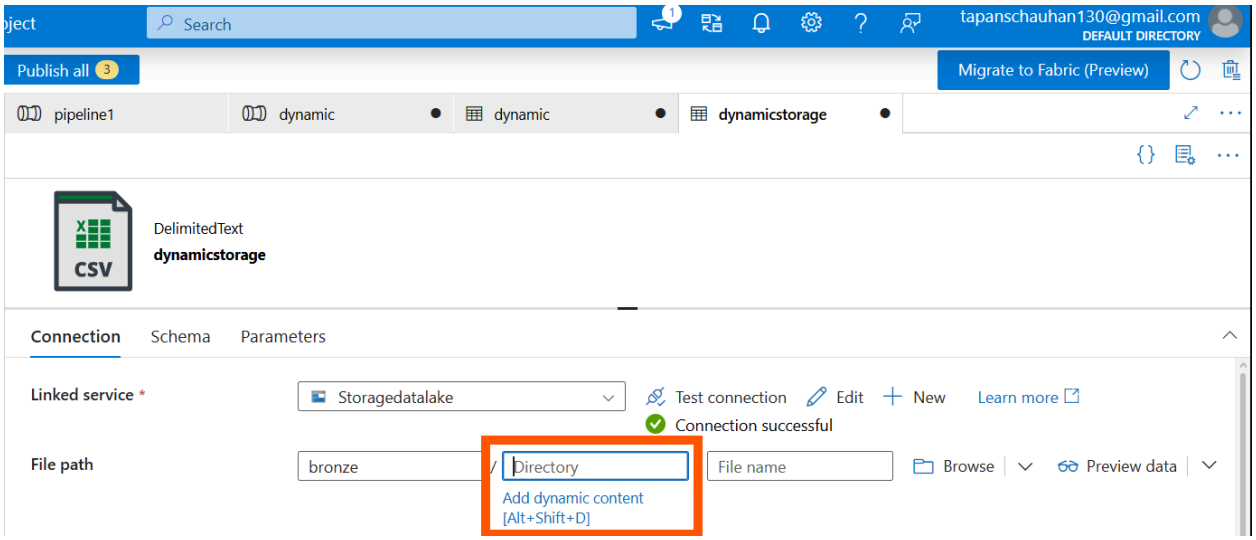


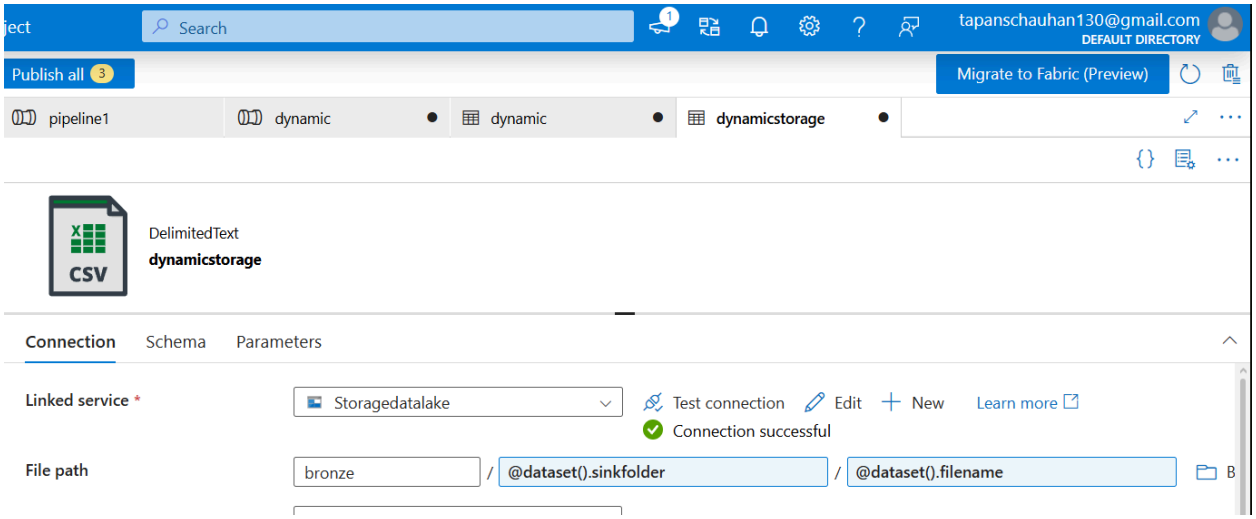
Copy data
DynamicCopy

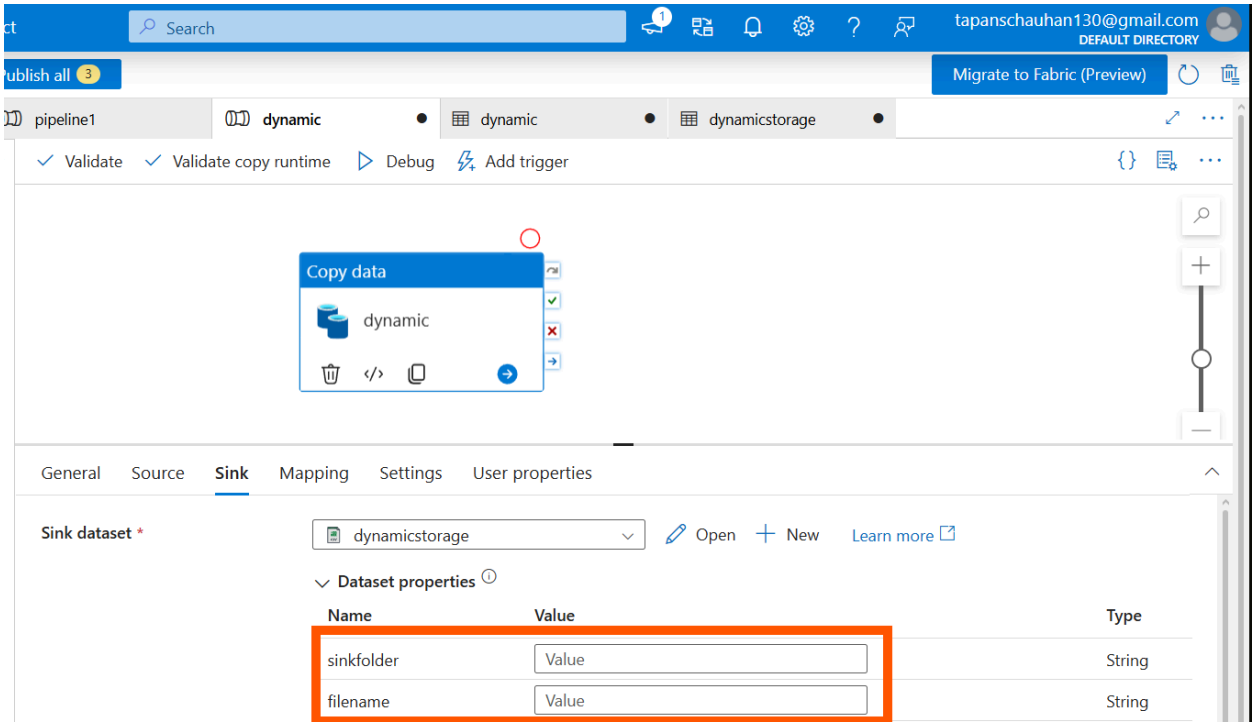


Mapping
Settings
User properties
ds_git_dynamic
Open
New
Preview data
Dataset properties
Name
Value
p_rel_url
Value
GET

Before putting the value in loop we will do same with sink







We will fill this value by for each activity

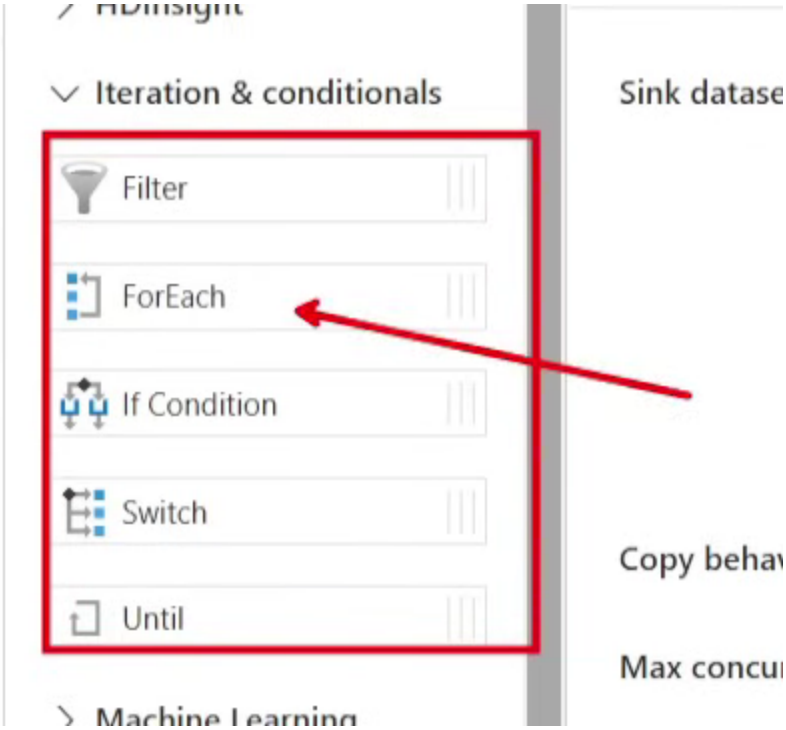
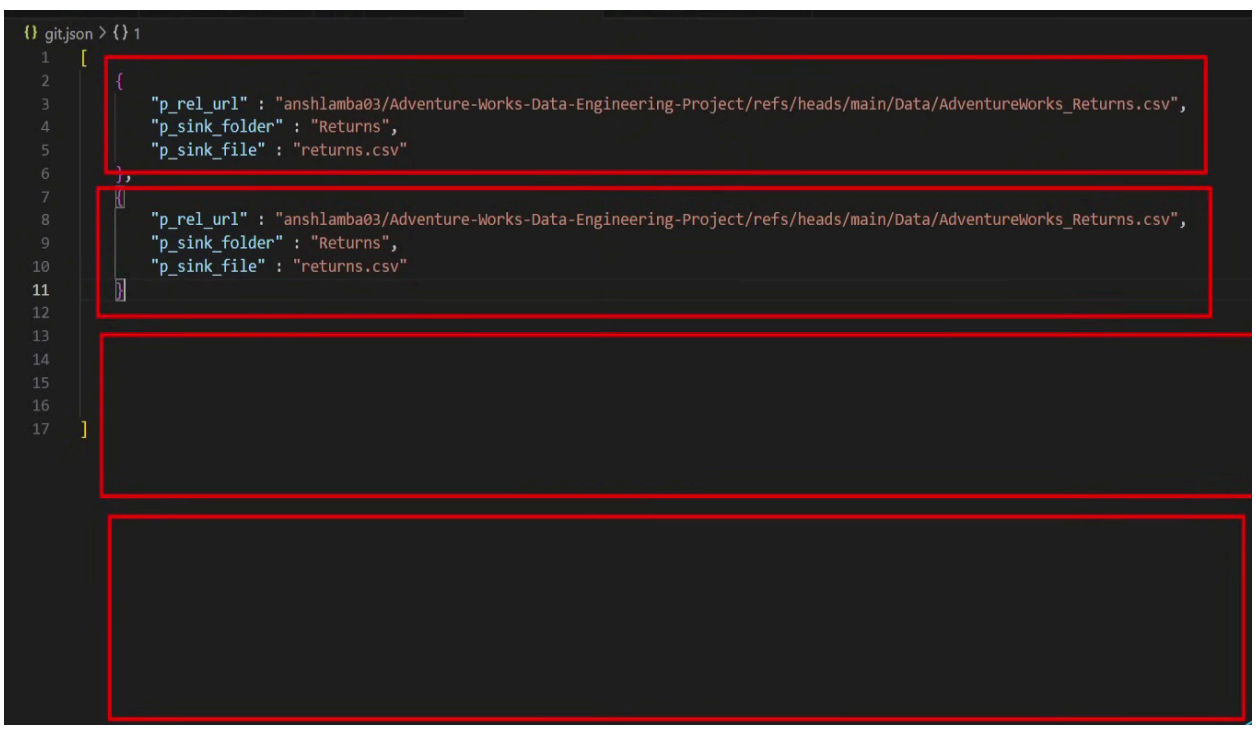
Iteration & conditionals
Machine Learning
Power Query



To pass elements here we will create a josn file

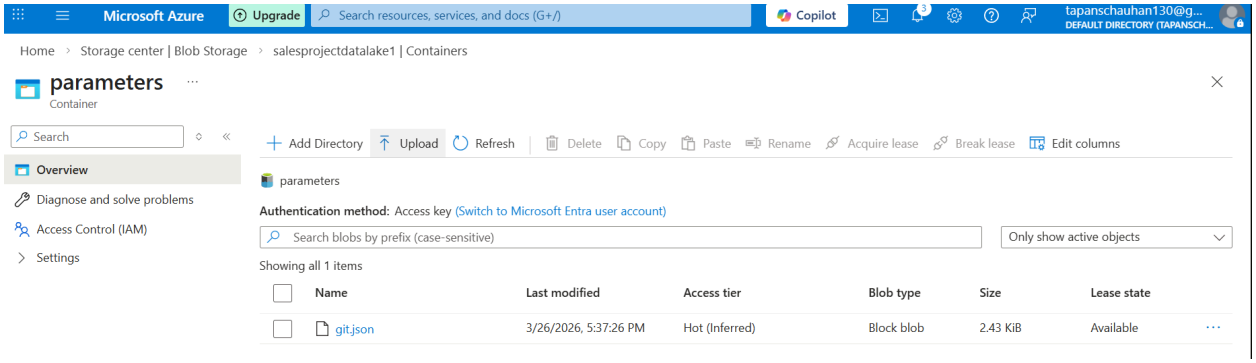
On vscode
It should have relative url,folder,file



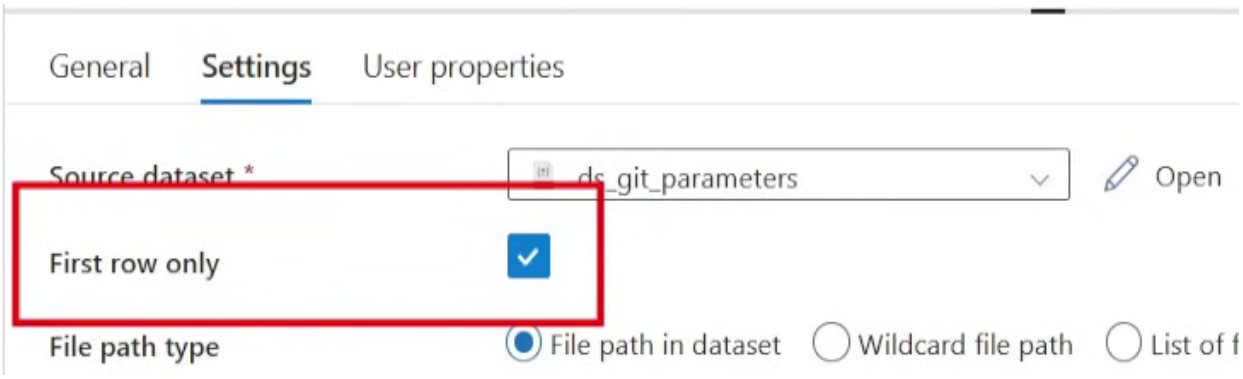
git.json > {} 1

```
[
    {
        "p_rel_url" : "anshlamba03/Adventure-Works-Data-Engineering-Project/refs/heads/main/Data/AdventureWorks_Returns.csv",
        "p_sink_folder" : "Returns",
        "p_sink_file" : "returns.csv"
    },
    {
        "p_rel_url" : "anshlamba03/Adventure-Works-Data-Engineering-Project/refs/heads/main/Data/AdventureWorks_Returns.csv",
        "p_sink_folder" : "Returns",
        "p_sink_file" : "returns.csv"
    }
]
```

Go on azure storage account , one new container for parameters

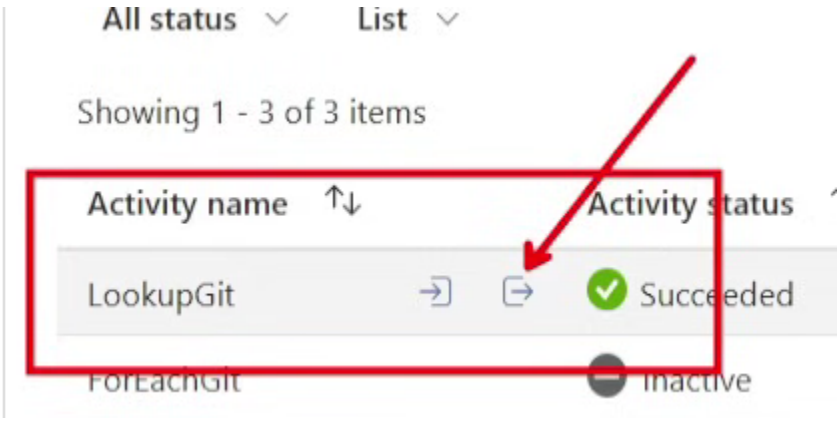


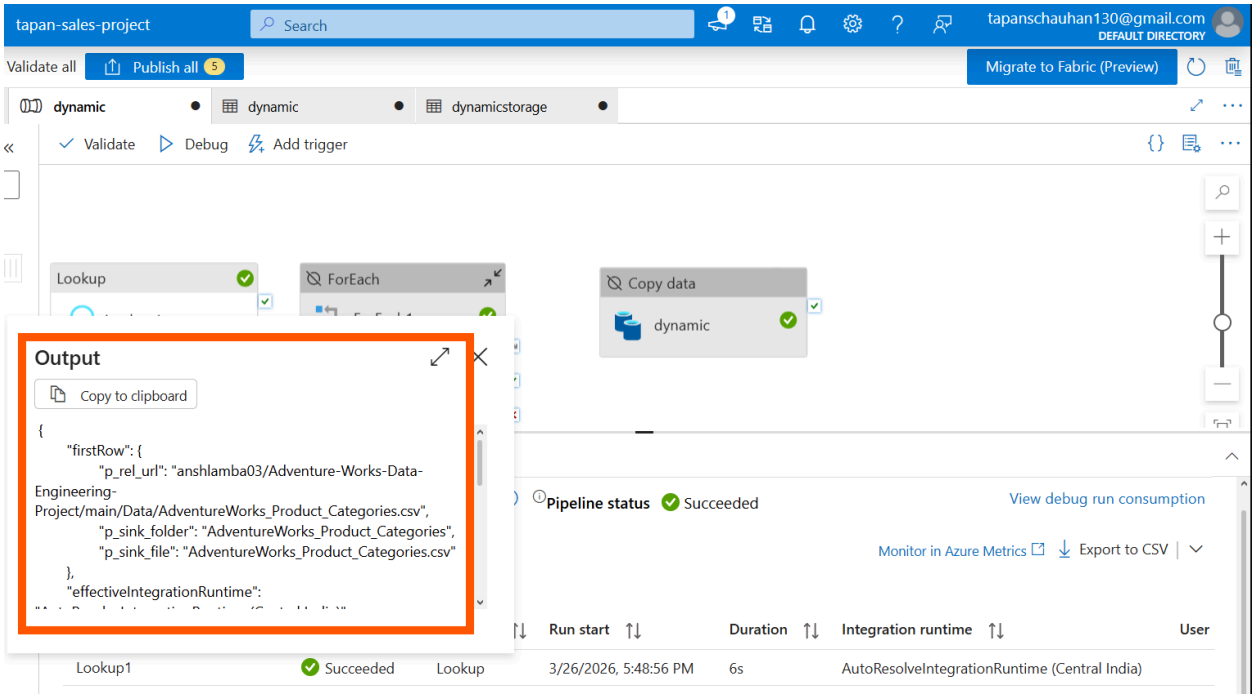
Now drag and drop ever time we have to create a new dataset



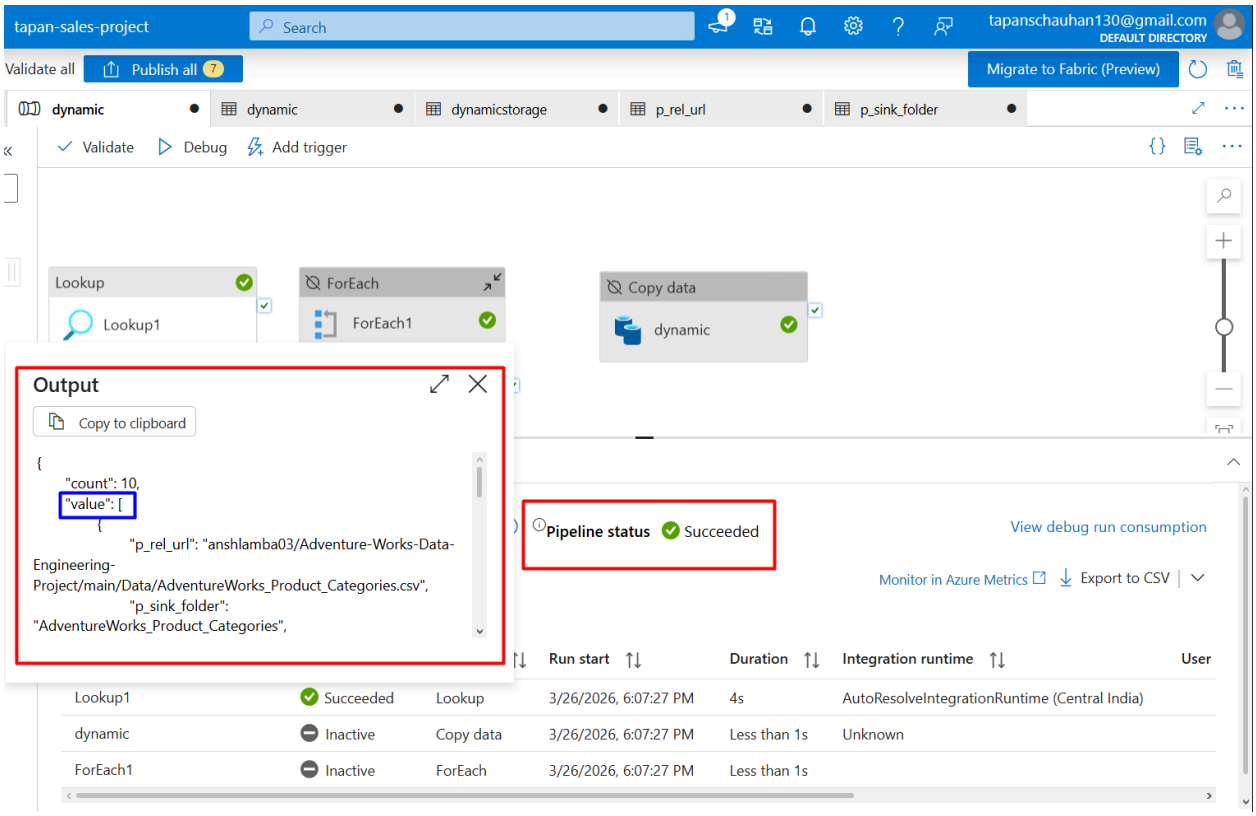
Untick this one

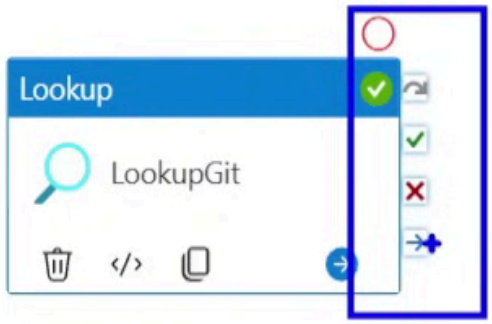
Now ignore copy and foreach activity and debug lookup

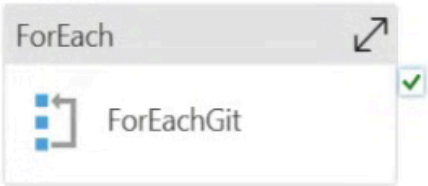




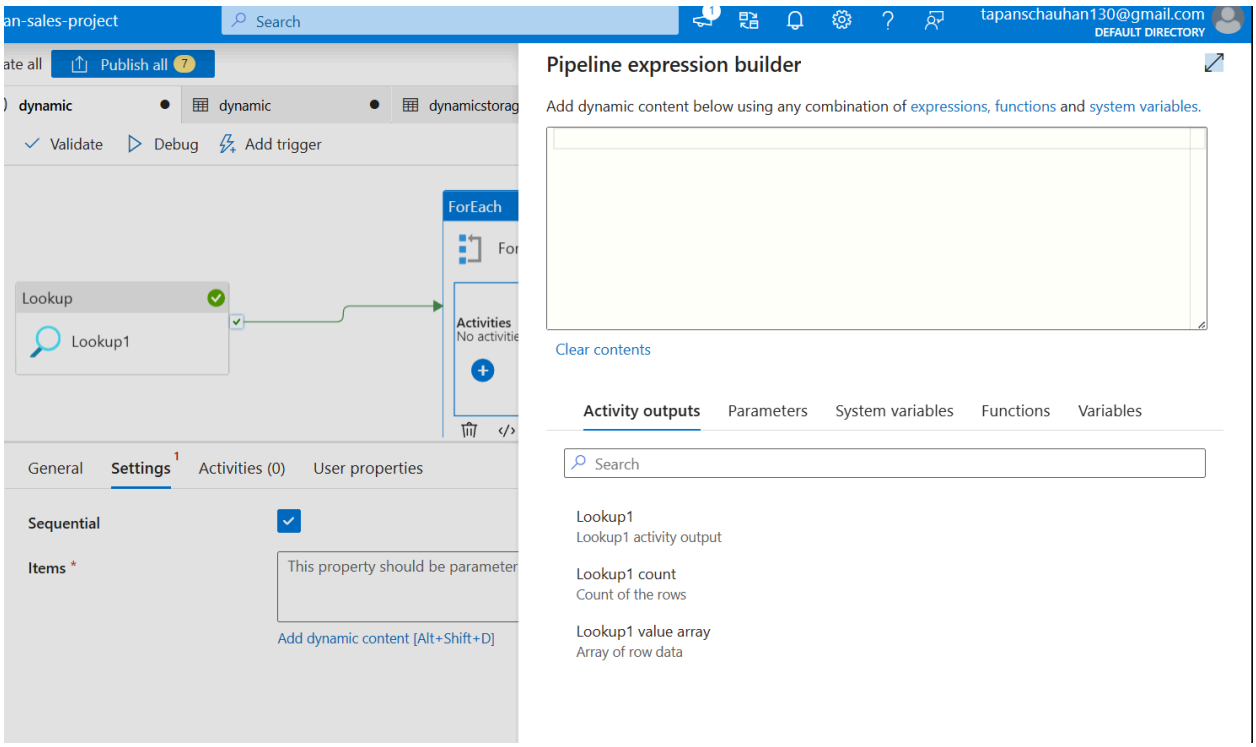
Under the value key we have all the information

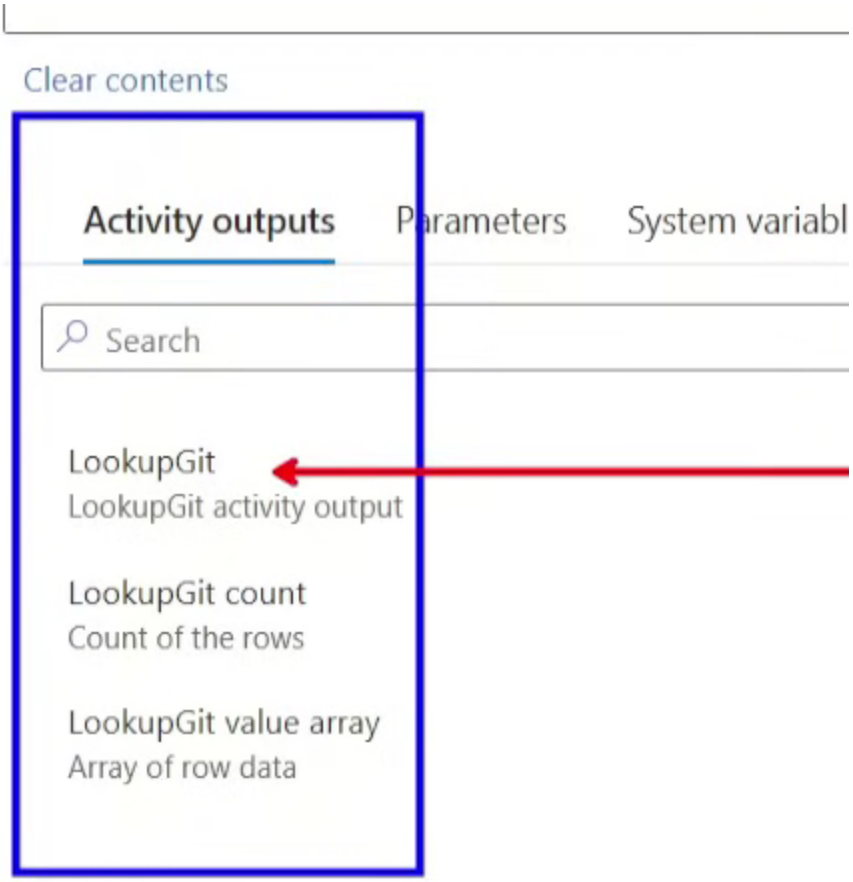


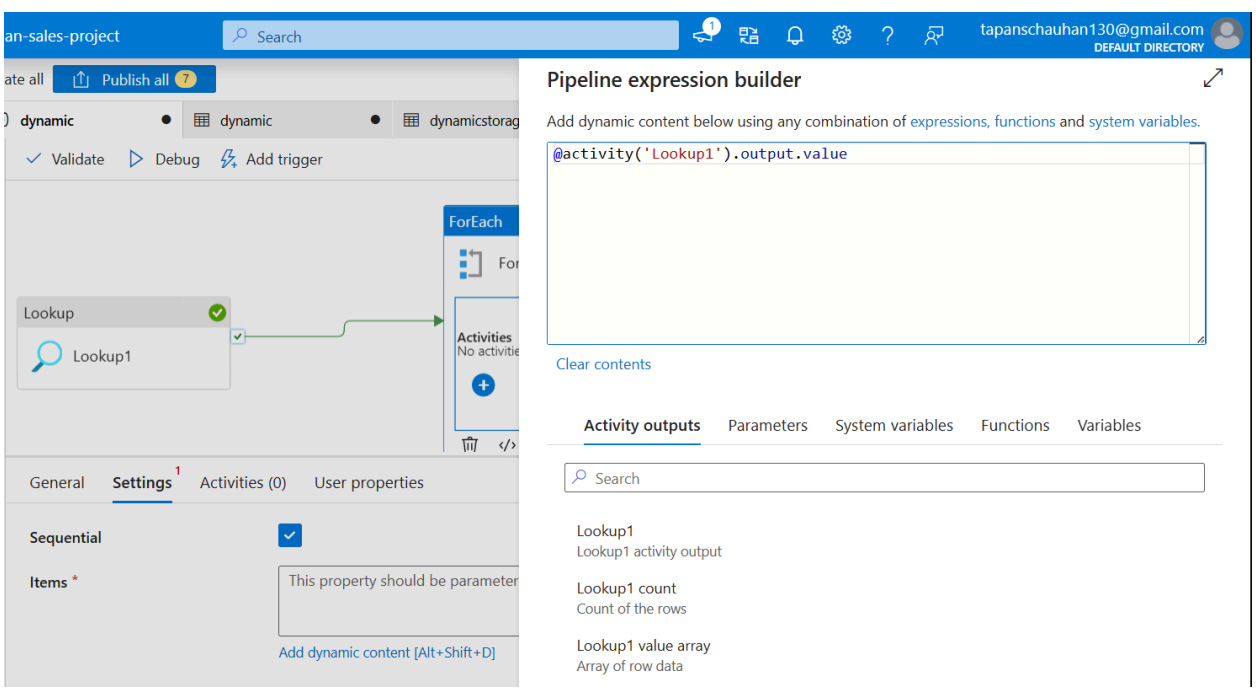




We will connect it via this



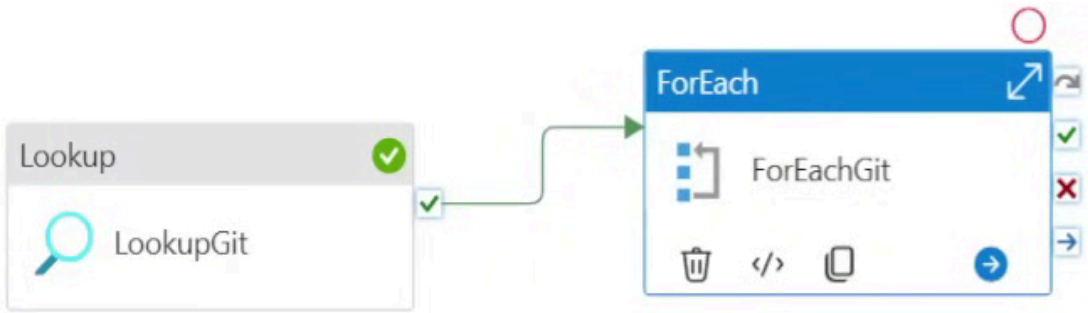


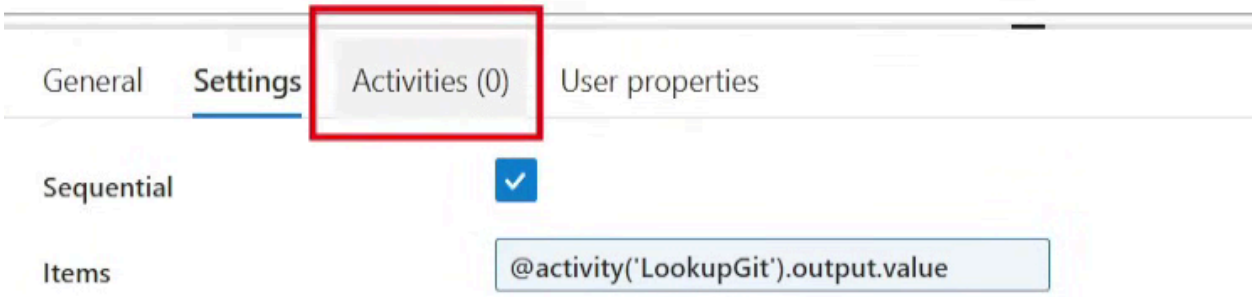


Very important to write .value after output then only it will work

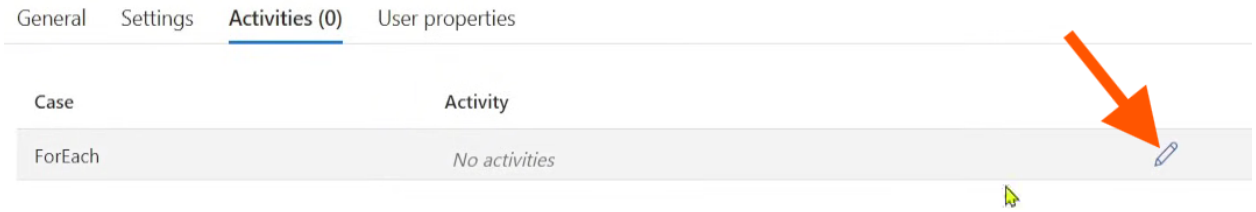
Now just follow this steps without any explanation

Control x the copy activity



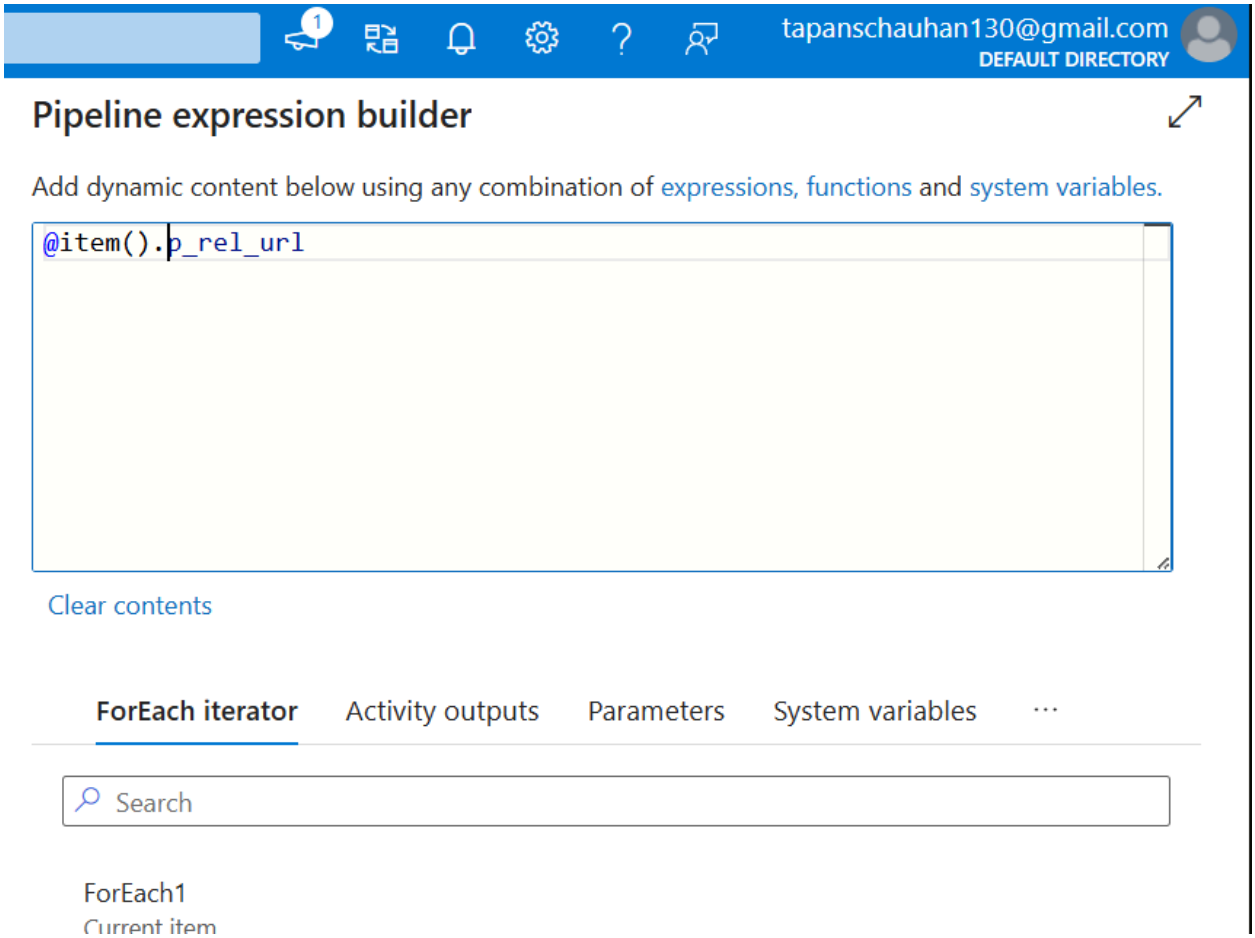


Put in activity tab

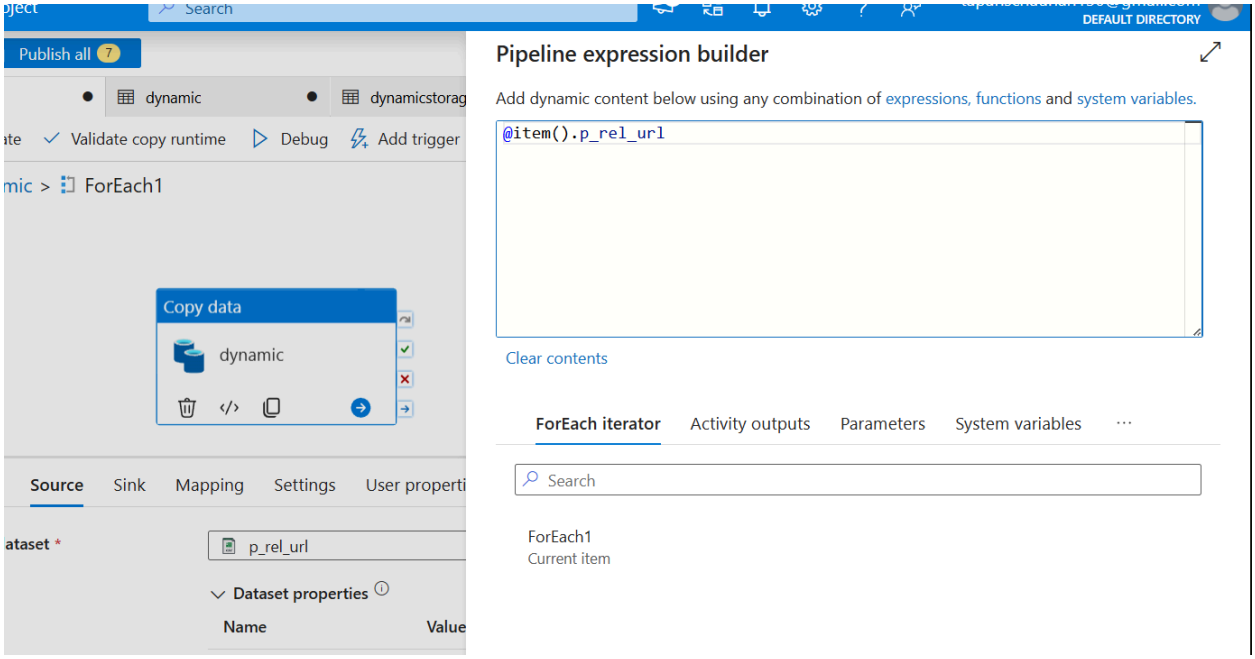


Past the copied activity here

Click on value

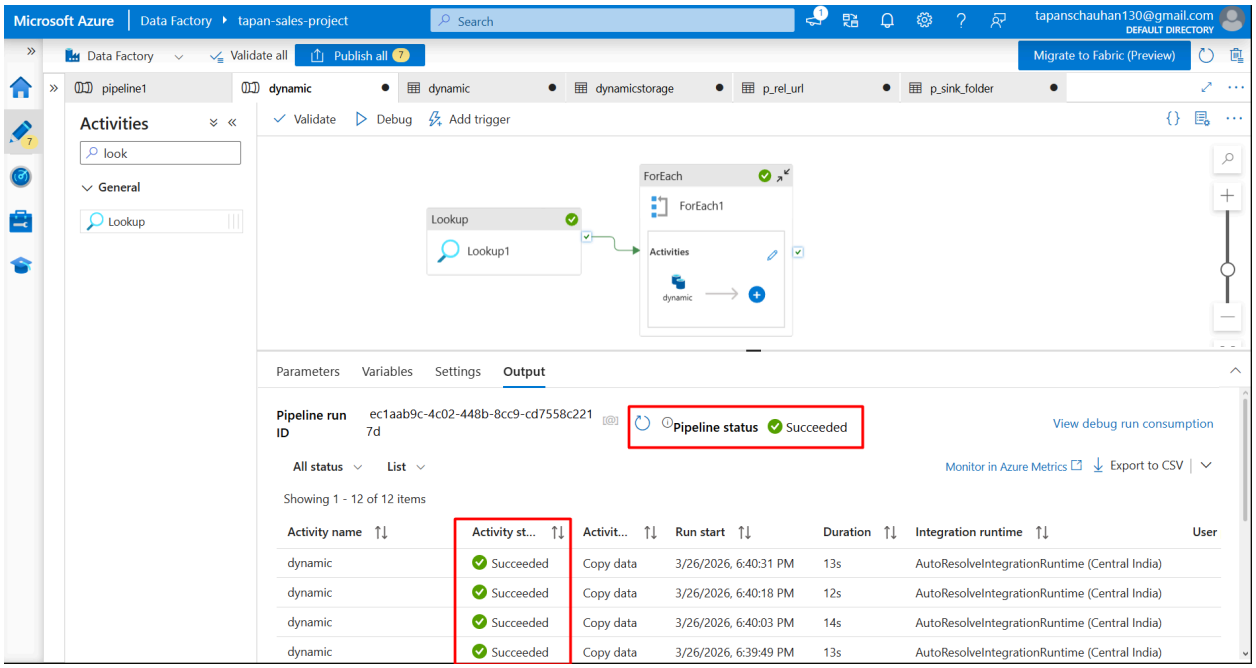


Very important



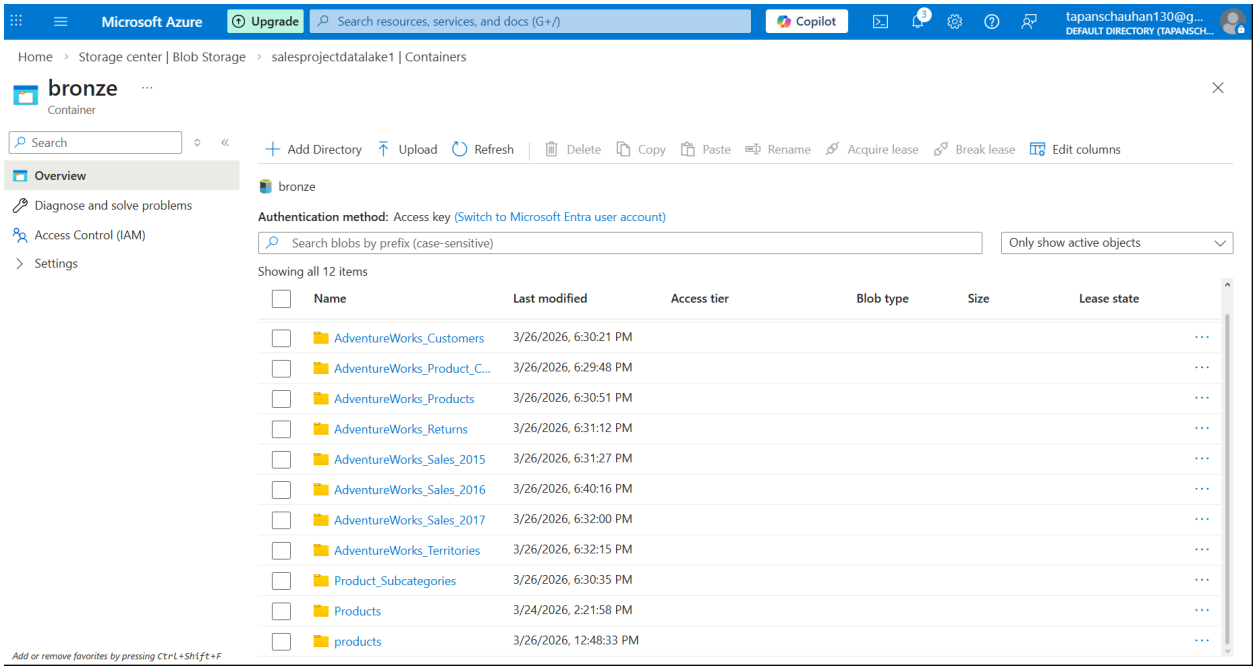
Same with the other 2

Now click deploy



Out pipeline got created.

Now let's validate it
Go to bronze container
And we can see our files there



Now we have deployed the dynamic pipeline. We will move further to silver layer
